

Daniel Jesutomiwa Olusakin

United Kingdom, London | olusakindaniel03@gmail.com | (+44) 7555388309 | [Linkedin](#) | [GitHub](#)
Portfolio: danielolusakin.com

TECHNICAL SKILLS

Languages: Java, Python, React, JavaScript, TypeScript, Node.js, HTML, CSS, MySQL, PostgreSQL, FileMaker Scripting
Tools: Git (GitHub/GitLab), Docker, Maven, AWS S3, Kafka, JUnit, Jest, VSCode, IntelliJ, Bun, NPM
Relevant Coursework: Data Structures and Algorithms, Database Systems, Software Development, Web Development, Object-Oriented Programming, Cloud Computing, AI & Machine Learning, Concurrency

EDUCATION

University of Kent Canterbury, Kent
Bachelor of Science in Computer Science: Expected 1st (82% Average) Sept 2023 - July 2026

WORK EXPERIENCE

Systems & Automation Intern Jan 2026 - Mar 2026
Art4site Wye, Kent

- Designed a **REST API integration** between FileMaker Pro and Intercom, automating multi-stage order updates and centralising communication history within a single conversation thread.
- Engineered **secure API workflows** using Bearer token authentication and JSON payloads, utilising **Postman** for endpoint testing and validation prior to production deployment.
- Optimised database schema** by implementing new relational fields and a dynamic templating engine that parses record data into context aware emails based on UI-triggered events.
- Reduced manual** administrative **overhead** through the development of UI-triggered scripts that automate customer notifications based on real-time production status.

Peer Tutor (Computer Science) Sept 2024 - Present
University of Kent Canterbury, Kent

- Assisted in instructing approximately **20+** students per session on **Object-Oriented Programming (OOP)** in Python and Java, translating theoretical concepts into practical project implementation.
- Deep-dive source code analysis to debug logic errors and provide targeted architectural guidance to improve code maintainability and reliability.

PROJECTS

Markdown Application | *React, TypeScript, Zod, Express.js, PostgreSQL, Prisma, AWS S3, Docker*

- Developed a full-stack application, implementing secure token-based authentication (JWT) and RESTful CRUD API.
- Used **Zod** for data validation between client and server and presigned URLs between client and AWS S3.
- Integrated **AWS S3** for scalable cloud storage of file attachments, managed via the backend API.

JPMorgan Software Engineering Simulation | *Java, Spring Boot, H2 SQL, Kafka, Incentives API*

- Spring Boot backend developed for a simulated financial system, integrating **Apache Kafka** for real-time transaction processing and H2 database for validated transaction persistence and balance management.
- RESTful API endpoints created (including a user balance query) to integrate with external Incentives API.

Harmony (AI Email Assistant) | *Next.js, TypeScript, React, PostgreSQL, Drizzle ORM, Stripe, Gmail/Outlook API*

- Collaborated utilising GitHub Actions CI/CD, issue-tracked workflows, and daily standups to ship a full-stack AI email assistant that auto-classifies mail and generates contextual draft replies via Gmail Pub/Sub and Outlook Graph hooks.
- Engineered a parallelised draft-context pipeline aggregating user details and learned writing style before generation.

EXTRACURRICULAR

2x ICHack26 Winner: Anthropic (Claude) & Hacktron AI | Led a team of 4 to build 'orbitSec', a gamified security developer tool using **FastAPI** and **React**. Developed a custom Python wrapper to bridge Windows and WSL for static analysis of **Claude** generated code with purposeful vulnerabilities via **Hacktron CLI**.

KentHackIt Winner | Built a multiplayer party game where players race to recreate a target image using text prompts fed to an AI image generator. Server-authoritative timing, Redis-only state, real-time presence via Pusher channels.

Google AI Hackathon | Selected as **1 of 55** UK candidates (450+ applicants) and developed a web application leveraging **Gemini API** and **Google Veo** for generative video integration.

EasyA Polkadot Hackathon (Blockchain) | Developed and pitched a decentralised chat application with a team that surpassed technical standards, earning DOT coin from the prize pool.
