

Daniel Olusakin

United Kingdom, London | olusakindaniel03@gmail.com | (+44) 7555388309 | [Linkedin](#) | [GitHub](#)
Portfolio: daniel-olusakin.netlify.app

TECHNICAL SKILLS

Languages: Java, Python, React, JavaScript, TypeScript, Node.js, HTML, CSS, MySQL, PostgreSQL, FileMaker Scripting
Tools: Git (GitHub/GitLab), Docker, Maven, AWS S3, JUnit, Jest, VSCode, IntelliJ, Bun, NPM
Relevant Coursework: Data Structures and Algorithms, Database Systems, Software Development, Web Development, Object-Oriented Programming, Cloud Computing, AI & Machine Learning, Concurrency

EDUCATION

University of Kent

Bachelor of Science in Computer Science: Expected **1st** (82% Average)

Canterbury, Kent
Sept 2023 - July 2026

WORK EXPERIENCE

Systems & Automation Intern

Jan 2026 - Present

Art4site

Wye, Kent

- Designed a **REST API integration** between FileMaker Pro and Intercom, automating multi-stage order updates and centralising communication history within a single conversation thread.
- Engineered **secure API workflows** using Bearer token authentication and JSON payloads, utilising **Postman** for endpoint testing and validation prior to production deployment.
- Optimised database schema** by implementing new relational fields and a dynamic templating engine that parses record data into context aware emails based on UI-triggered events.
- Reduced manual** administrative **overhead** through the development of UI-triggered scripts that automate customer notifications based on real-time production status.

Peer Tutor (Computer Science)

Sept 2024 - Present

University of Kent

Canterbury, Kent

- Assisted in instructing approximately **20+** students per session on **Object-Oriented Programming (OOP)** in Python and Java, translating theoretical concepts into practical project implementation.
- Deep-dive source code analysis to debug logic errors and provide targeted architectural guidance to improve code maintainability and reliability.

PROJECTS

Markdown Application | React, JavaScript, TypeScript, Express.js, PostgreSQL, AWS S3, Docker

- Developed a full-stack application, implementing secure token-based authentication (JWT) and developing a RESTful CRUD API.
- Integrated **AWS S3** for scalable cloud storage of file attachments, managed via the backend API.

JPMorgan Software Engineering Simulation | Java, Spring Boot, H2 SQL, Kafka, Incentives API

- Spring Boot backend developed for a simulated financial system, integrating **Apache Kafka** for real-time transaction processing and H2 database for validated transaction persistence and balance management.
- RESTful API endpoints created (including a user balance query) to integrate with external Incentives API.

Library Management System | Java, MySQL, Docker, Maven, Book API

- Comprehensive system to efficiently track books, users, and rental transactions, focusing on CRUD operations.
- Authentication secured by salting then hashing data passed during registration.
- Unit tested to validate methods ensuring code reliability, while emphasis put on UI/UX with FlatLaf design.

EXTRACURRICULAR

2x ICHack 26 Winner: Anthropic (Claude) & Hacktron AI | Led a team of 4 to build "orbitSec," a gamified security developer tool using **FastAPI** and **React**. Developed a custom Python wrapper to bridge Windows and WSL for static analysis of **Claude** generated code with purposeful vulnerabilities via **Hacktron CLI**.

Google AI Hackathon | Selected as **1 of 55** candidates globally (from 450+ applicants) to develop a web application leveraging **Gemini API** and **Google Veo** for generative video integration.

EasyA Polkadot Hackathon (Blockchain) | Developed and pitched a decentralised chat application with a team that surpassed technical standards, earning DOT coin from the prize pool.

ICHack 25 | Led a team to build an AI code feedback engine using Python (Flask) utilising OpenAI's API. Pitched MVP to JetBrains representatives and gained good recognition.
